The differential equations of this problem, in the case where the radii are supposed to describe no areas, were first integrated by Binet. But the addition, to the forces, of the terms arising from centrifugal action, much enhances the interest of the problem. See Liouville, Journal de MatlUmatiquet, First Ser., Tome II, p. 457. MEMOIR No. U. On the Interior Constitution of the Earth as Respects Density. (Annals of Mathematics, Vol. IV, pp. 19-29, 1888.) Nearly all the matter accessible to us is found to be porous. Thus the application of pressure to it tends to reduce the amount of porosity and, in consequence, augments the density of the mass. Moreover, the greater the pressure the greater is the increment of density. A familiar instance of this is the case of atmospheric air or a gas in which, provided the temperature remains constant, the density varies directly as the pressure. It is natural to think that the matter of which the earth is composed is not excepted from this law. At small depths, it is true, the rigidity of the earth s mass interferes with its exerting any pressure, as the existence of caves shows. But at great depths where the weight of the superincumbent mass becomes very great, it is extremely probable the molecular force of cohesion gives way in a manner which allows pressure to act; which is illustrated by the behavior of ice in a glacier. I propose to...
